

GESTAVET[®] PROST

agilis

Gestavet-PROST

Prostaglandin injection for oestrus synchronisation, induction of parturition, early pregnancy termination, treatment of persistent corpora lutea, luteal cysts, chronic endometritis and pyometra.

Summary:

Gestavet-Prost will induce luteolysis of functional corpora lutea and combined with a drop in circulating progesterone concentrations will usually lead to a return to oestrus within 2-4 days. May be used in conjunction with oestrus synchrony programmes.

Composition:

D-cloprostenol (as sodium salt) 75µg/ml for injection.

Available in 50ml and 100ml bottles.

Dosage:

2ml by intramuscular injection. (Equivalent to 150µg d-cloprostenol/animal).

Nil Meat or milk withholding.

Store at 2-8°C. Temperature controlled to maximise bioavailability of the product.

Contraindications and special precautions:

Do not use in pregnant animals when abortion or induced parturition is not desired.

Do not administer intravenously.

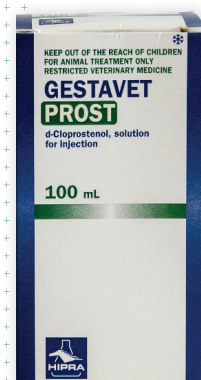

This product should not be handled by pregnant women or people suffering asthma or bronchial problems.

Avoid contact with skin, wash hands upon exposure. It is advisable to wear gloves when using this product.

REPRODUCTION HORMONE;
CLOPROSTENOL IN AN
INJECTABLE SOLUTION.
